EXECUTIVE SUMMARY

This traffic impact study analyzes potential traffic impacts of proposed single family and apartment complex residential developments for the four land parcels located at the Arrowhead Center in Spanish Fork, Utah. The study considers current conditions (2018), conditions directly after development (2022), and future conditions (2027). Traffic from five intersections and adjacent roadways surrounding the parcels is included in this analysis. Conditions were analyzed in accordance with Access Application Level II from the Traffic Impact Study Guidelines provided by the Utah Department of Transportation (UDOT).

TRAFFIC ANALYSIS

An outline of the traffic analysis performed by GSM Engineers for this project is found below.

Existing (2018) Conditions Analysis

GSM Engineers obtained weekday AM and PM peak traffic counts at the following intersections:

- South Mill Road and SR-164/Arrowhead Trail Road
- SR-164/Arrowhead Trail Road and Calpac Avenue
- SR-164/Arrowhead Trail Road and Del Monte Road
- SR-198/Main Street and SR-164/Arrowhead Trail Road
- SR-198/South State Road and Woodland Hills Drive

These counts were performed on various weekdays between Tuesday-Thursday from 7:00 - 9:00 AM and 4:00 - 6:00 PM to satisfy Spanish Fork City requirements. Greater volumes were counted at the major intersections for the AM peak hour than for the PM peak hour. Traffic volumes were largest from 7:15 AM to 8:15 AM, as shown in traffic count data in Appendix A.

As shown in Table ES-1, three intersections have acceptable delays, and two are failing according to a standard Level of Service (LOS) C, as required by the Spanish Fork Master Plan. Recommendations for failing intersections will be discussed in the body of the report.

Project Conditions Analysis

The proposed development has been identified as multi-family residential for parcels A and B and single-family homes for parcels C and D.

Trip generation for the project was computed using data published in the Institute of Transportation Engineers (ITE), *Trip Generation, 9th Edition, Volume 2*. The projected trip generation for the proposed land use is below:

- Daily: 1862 trips
- Morning Peak Hour: 145 trips
- Evening Peak Hour: 180 trips

Future (2022) Background Conditions Analysis

As shown in Table ES-1, three intersections have an acceptable LOS, and two are failing according to a standard LOS C, as required by the Spanish Fork Master Plan. Mitigations and improvements for failing intersections will be discussed in the body of the report.

Future (2022) Plus Project Conditions Analysis

As shown in Table ES-1, three intersections have acceptable delays, and four are failing according to a standard LOS C, as required by the Spanish Fork Master Plan. Mitigations and improvements for failing intersections will be discussed in the body of the report.

Future (2027) Background Conditions Analysis

As shown in Table ES-1, three intersections have acceptable delays, and two are failing according to a standard LOS C, as required by the Spanish Fork Master Plan. Mitigations and improvements for failing intersections will be discussed in the body of the report.

Future (2027) Plus Project Conditions Analysis

As shown in Table ES-1, three intersections have acceptable delays, and four are failing according to a standard LOS C, as required by the Spanish Fork Master Plan. Mitigations and improvements for failing intersections will be discussed in the body of the report.

RECOMMENDATIONS

The following mitigations and improvements are recommended:

Existing (2018) Conditions Analysis

- South Mill Road and SR-164/Arrowhead Trail Road
 - Convert the westbound segment to one combined through and left turn lane with 2 right turn pockets
 - Increase the minimum initial green time and maximum split time on the same approach
- SR-198/South State Road and Woodland Hills Drive
 - Convert the existing intersection to a signalized intersection

Future (2022) Background Conditions Analysis

- See recommendations for Existing (2018) Conditions

Future (2022) Plus Project Conditions Analysis

- 2 Proposed Intersections along SR-198/Main Street
 - Disallow through and left turn movements
- See recommendations for Existing (2018) Conditions

Future (2027) Background Conditions Analysis

- See recommendations for Existing (2018) Conditions

Future (2027) Plus Project Conditions Analysis

- See recommendations for Existing (2018) Conditions
- See recommendations for Future (2022) Plus Project Conditions

I. INTRODUCTION

A. Purpose

This traffic impact study addresses potential traffic impacts of proposed mixed residential and commercial developments for the four land parcels located at the Arrowhead Center in Spanish Fork, Utah. The study analyzes current conditions (2018), conditions directly after development (2022), and future conditions (2027). Traffic from five intersections and adjacent roadways surrounding the parcels is included in this analysis. Conditions were analyzed in accordance with Access Application Level II from the Traffic Impact Study Guidelines provided by the Utah Department of Transportation (UDOT).

B. Scope

The study area was defined after correspondence with the sponsor. This study was scoped to evaluate the traffic operation impacts of the project on the following intersections:

- South Mill Road and SR-164/Arrowhead Trail Road
 - Signalized Three-Way Intersection
- SR-164/Arrowhead Trail Road and Calpac Avenue
 - Unsignalized Three-Way Intersection with stop control on single minor approach
- SR-164/Arrowhead Trail Road and Del Monte Road
 - Signalized Four-Way Intersection
- SR-198/Main Street and SR-164/Arrowhead Trail Road
 - Unsignalized Four-Way Stop Intersection with stop control on minor approaches
- SR-198/South State Road and Woodland Hills Drive
 - Signalized Four-Way Stop

C. Analysis Methodology

LOS describes the operational performance of an intersection or roadway. LOS is reported on a scale from A to F, with A representing the best performance and F the worst. Table 1 provides a brief description of each LOS letter designation and an accompanying average delay per vehicle for both signalized and unsignalized intersections.

The Highway Capacity Manual 2010 (HCM 2010) methodology was used in this study to be consistent with “state-of-the-practice” professional standards. Signalized and unsignalized intersections are evaluated differently. The LOS for a signalized intersection is determined for the overall intersection, averaging all of the approach delays. The LOS for an unsignalized intersection is determined based on the worst approach.

Table 1: LOS Descriptions

LOS	Description of Traffic Conditions	Average Delay (seconds/vehicle)
Signalized Intersections		Overall Intersection
A	Free Flow	$0 \leq 10.0$
B	Stable Flow (slight delays)	$> 10.0 - 20.0$
C	Stable Flow (acceptable delays)	$> 20.0 - 35.0$
D	Approaching unstable flow (tolerable delay occasionally wait through more than one signal before proceeding)	$> 35.0 - 55.0$
E	Unstable flow (intolerable delay)	$> 55.0 - 80.0$
F	Forced flow (congested and queues fail to clear)	> 80.0
Unsignalized Intersections		Worst Approach
A	Insignificant Delay on Worst Approach	$0 \leq -10.0$
B	Minimum Delay on Worst Approach	$> 10.0 - 15.0$
C	Acceptable Delay on Worst Approach	$> 15.0 - 25.0$
D	Tolerable Delays on Worst Approach	$> 25.0 - 35.0$
E	Significant Delays on Worst Approach	$> 35.0 - 50.0$
F	Excessive delays on Worst Approach	> 50.0

Source: Highway Capacity Manual, 2010 Methodology (Transportation Research Board, 2010)

D. LOS Standards

For the project purposes, a minimum overall intersection performance for each of the study intersections was set at LOS C. However, if LOS D, E or F for conditions exist, a recommendation for improvement will be provided. A LOS D threshold is consistent with “state-of-the-practice” traffic engineering principles, but in accordance with the Spanish Fork Master Plan, a LOS C threshold is desired.

II. EXISTING (2018) CONDITIONS ANALYSIS

A. Purpose

The purpose of the existing (2018) conditions analysis is to evaluate the current status of selected intersections and roadways during peak hour traffic. Through this analysis, any existing flaws or failures can be identified and corresponding mitigation measures can be suggested. The existing conditions will be used to project traffic volumes to predict future deficiencies that may be caused by the proposed development.

B. Roadway System

The major roadways that may function as access points to the project site are described below:

SR-164/Arrowhead Trail Road is a state-operated roadway with a rural major collector classification. This roadway is currently comprised of a series of two cross sections. Beginning at the intersection of SR-198/Main Street and SR-164/Arrowhead Trail Road, the roadway has a three-lane cross section with one through travel lane in each direction and a center two-way left turn lane (TWLTL). Between Calpac Avenue and Del Monte Road, the roadway tapers to a two-lane cross section with one through travel lane in each direction. Between the intersections with Del Monte Rd and South Mill Rd, there is a small segment with 2 lanes on the eastbound side. The speed limit is 45 mph. According to UDOT qualifications, this roadway is classified as an access category 2 classification. Presently all minimum signal and street spacing requirements are met. The spacing between the intersection of Arrowhead Trail Road with Calpac Avenue and the intersection with Main St appears to be close to the 1000 ft spacing requirement. Driveway requirements for this classification are not met.

SR-198/Main Street is a state-operated roadway rural minor arterial classification. This roadway is currently comprised of a three-lane cross section with one through travel lane in each direction and a center TWLTL. The speed limit is 55 mph. According to UDOT qualifications, this road seems to be a category 2 classification. Presently all minimum signal and street spacing requirements are met. Driveway requirements for this classification are not met.

C. Traffic Volumes

GSM Engineers collected traffic data during AM and PM peak hours between 7:00 - 9:00 AM and 4:00 - 6:00 PM, respectively, at the following intersections:

- South Mill Road and SR-164/Arrowhead Trail Road
- SR-164/Arrowhead Trail Road and Calpac Avenue
- SR-164/Arrowhead Trail Road and Del Monte Road
- SR-198/Main Street and SR-164/Arrowhead Trail Road
- SR-198/South State Road and Woodland Hills Drive

Counts were collected during the appropriate times on various dates. Due to traffic data collection over multiple days, volumes between intersections did not align. Traffic volumes were adjusted based on the volumes at the intersection of Arrowhead Trail Road and Main Street. Original count data is included in Appendix A, while altered volumes can be found in the Synchro LOS analysis results in Appendix B. The peak hour was determined to be in the morning from 7:15 AM to 8:15 AM.

From UDOT data, the percent of heavy traffic was determined to be high for the area, so 4 percent of traffic was assumed to be truck traffic.

D. LOS Analysis

Synchro Software was used to determine the peak hour LOS for each intersection. The results for the background 2018 model serve as a baseline condition for the impact analysis of the Arrowhead Center development during the existing conditions. LOS reports from Synchro are contained in Appendix B of this traffic impact study. As shown in Table 2, three intersections have an acceptable LOS, and two are failing.

Table 2: Existing 2018 Background Level of Service

Intersection	Existing 2018 Background
Del Monte Road and SR-164 Arrowhead Trail Road	C
Calpac Avenue and SR-164 Arrowhead Trail Road	B
Woodland Hills Drive and SR-198	F
South Mill Road and Arrowhead Trail Road	F
SR-164 Arrowhead and Main street	B

E. Mitigation Measures

The intersection of Woodland Hills Drive and SR-198 as well as the intersection of South Mill Road and Arrowhead Trail Road are the only intersections surrounding the property that fall below LOS C in 2018. Both the intersections are LOS F while the others are LOS B or LOS C. No mitigation measures are recommended for the intersections that are LOS C and higher.

The following mitigation measures are recommended at the intersection of Woodland Hills Drive and SR-198:

- Convert the westbound segment to one combined through and left turn lane with 2 right turn pockets
- Increase the minimum initial green time and maximum split time on the same approach

At the intersection of South Mill Road and Arrowhead Trail Road the following mitigation measure is recommended:

- Convert the existing intersection to a signalized intersection

III. PROJECT CONDITIONS

A. Purpose

The purpose of the project conditions is to explain the development plans for the four parcels. These plans are used for trip generation, distribution, and assignment to predict the amount of traffic the new development will add to the project area.

B. Project Description

A summary of the proposed development is found below in Table 3. These proposed developments are addressed in this study to analyze the generated traffic and determine whether any mitigation measures are necessary. The parcels are located around the Arrowhead center.

Table 3: Land Use Description

Parcel	Apartment Buildings	Units per Building	Multi Family Homes	Residential Lots
A	22	3	71	0
B	25	3	70	0
C	0	0	0	50
D	0	0	0	45

C. Trip Generation

Trip generation for the project was calculating using trip generation rates published in the Institute of Transportation Engineers (ITE) Trip Generation, 9th Edition, 2012. The ITE trip generation rates identify gross trips to and from the Arrowhead Center project and do not account for trips already on adjacent roadways. GSM Engineers adjusted the gross trip generation to account for internal trips between residential land uses. No pedestrian or pass-by trip reductions were made.

Table 4: Trip Generation

Time	Trip Generation
AM Peak Hour	145
PM Peak Hour	180
Weekday	1869

Two site plans were submitted. One by Fritzi Realty and one by another Engineering firm. The other Engineering firm proposed land use identified as single housing and commercial. The proposal by the other Engineering firm would have generated 702 AM trips and 19,984 weekday trips which could significantly change the outcome of this study. This study covers the site plan submitted by Fritzi Realty.

D. Trip Distribution and Assignment

Project traffic is assigned based on the type of trip and the distance of the project access points to major roadways, high population densities, and trip attractions. Distribution percentages were determined using existing travel patterns observed during traffic count data collection. The resulting overall distribution of project generated trips is as follows:

To/from the Development

- 7% West on Del Monte Road
- 58% North on SR-198/Main Street
- 18% South on SR-198/State
- 7% South on SR-164/Arrowhead Trail Road
- 10% East on Woodland Hills Drive

Trip generation assignment is shown in Figure 8 of Appendix D.

E. Access Spacing

Two new intersections will be developed along SR-198, one three-way intersection and one four-way intersection. Calpac Avenue and Arrowhead Trail Road will be moved to the west. Currently, the intersection of Calpac Avenue and Arrowhead Trail Road is about 1000 ft from intersection of Arrowhead Trail Road and Main Street. 1000 ft is the minimum spacing between roads for a UDOT category 2 road. The movement of the Calpac Avenue intersection to the west will allow increased access spacing. The distance between 2 new intersections on Main Street may be slightly close together based on a category 2 street, and may require special permissions from the city.

IV. FUTURE (2022) BACKGROUND CONDITIONS

A. Purpose

The purpose of the future (2022) background conditions is to analyze the future traffic conditions around the property parcels at the project location. The analysis of future background conditions will enable GSM Engineers to predict future traffic deficiencies and recommend mitigation measures in order to reduce inefficiency at the intersections surrounding Arrowhead Center.

B. Traffic Volumes

Traffic volumes for the future year 2022 were projected using the altered counts collected by GSM Engineers and an annually compounded traffic growth rate of 3.6%. This growth rate was found using 10 years of historical Annual Average Daily Traffic (AADT) data provided by UDOT.

C. LOS Analysis

Synchro Software was used to determine the peak hour LOS for each intersection. The results for the background 2022 model serve as a baseline condition for the impact analysis of the Arrowhead Center development in 2022. LOS reports from Synchro are contained in Appendix B of this traffic impact study. As shown in Table 5, three intersections have an acceptable LOS, and two are failing.

Table 5: Future 2022 Background Level of Service

Intersection	Future 2022 Background
Del Monte Road and SR-164 Arrowhead Trail Road	C
Calpac Avenue and SR-164 Arrowhead Trail Road	B
Woodland Hills Drive and SR-198	F
South Mill Road and Arrowhead Trail Road	F
SR-164 Arrowhead and Main street	B

D. Mitigation Measures

The intersection of Woodland Hills Drive and SR-198 as well as the intersection of South Mill Road and Arrowhead Trail Road are the only intersections surrounding the property that fall below LOS C in 2022. Both the intersections are LOS F while the others are LOS B or LOS C, as was the case in 2018. Mitigation measure recommendations for the failing intersections are found in part II. Existing (2018) Conditions, section E: Mitigation Measures.

V. FUTURE (2022) PLUS PROJECT CONDITIONS

A. Purpose

The purpose of the future 2022 plus conditions is to examine the traffic impacts of the proposed project at each of the intersections during future 2022 conditions. The trips generated by the project development were combined with the future 2022 background traffic volumes to create the future plus project condition. The plus project conditions detail the important potential impacts of the proposed project on future background traffic conditions.

B. Traffic Volumes

Trips were assigned to the project location intersections based on the trip distribution percentages and permitted intersection turning movements. Base volumes were taken from the Future 2022 Background Conditions.

C. LOS Analysis

Synchro Software was used to determine the peak hour LOS for each intersection. The results for the project conditions 2022 model serve as the condition for the impact analysis of the Arrowhead Center development in 2022 just after the development has been constructed. LOS reports from Synchro are contained in Appendix B of this traffic impact study. As shown in Table 6, the same three intersections have an acceptable LOS, and the other two are failing. The two new intersections along Main Street or SR-198 are failing as soon as they are constructed.

Table 6: Future 2022 Plus Project Level of Service

Intersection	Future 2022 Plus Project
Del Monte Road and SR-164 Arrowhead Trail Road	C
Calpac Avenue and SR-164 Arrowhead Trail Road	B
Woodland Hills Drive and SR-198	F
South Mill Road and Arrowhead Trail Road	F
SR-164 Arrowhead and Main street	B
New 3-Way Intersection with SR-198	D
New 4-Way Intersection with SR-198	F

D. Mitigation Measures

No mitigation measures are recommended for the intersections that are LOS C and higher. See Existing (2018) Conditions Section E: Mitigation Measures for recommendations at the intersection of Woodland Hills Drive and SR-198 and the intersection of South Mill Road and Arrowhead Trail Road.

Synchro analysis reports also showed in the future 2022 plus project conditions, the three-way intersection and four-way intersection along SR-198 will be LOS D and F respectively. To improve these intersections the following mitigation measure is recommended:

- Disallow through and left turn movements

VI. FUTURE (2027) BACKGROUND CONDITIONS

A. Purpose

The purpose of the future 2027 background conditions is to analyze the base future traffic conditions around the parcels at the project location for 2027. The analysis of future background conditions will enable GSM Engineers to predict future traffic deficiencies and recommend mitigation measures in order to reduce inefficiency at the intersections surrounding Arrowhead Center.

B. Traffic Volumes

Traffic volumes for the future year 2027 were predicted using an annually compounded 3.6% growth rate and altered traffic counts collected by GSM Engineers. The growth rate was obtained using 10 years of historical Annual Average Daily Traffic (AADT) data provided by UDOT.

C. Background Geometric Changes

Some background changes were assumed to have occurred along Main Street by the year 2027. According to the City of Spanish Fork's Transportation Master Plan, the number of lanes along Main Street will be increased from two lanes to four lanes.

D. LOS Analysis

Synchro Software was used to find the peak hour LOS for each intersection surrounding the project. The results from Synchro for the background 2027 serve as a baseline condition for the impact analysis of the Arrowhead Center development in 2027. LOS reports from Synchro are contained in Appendix B of this traffic impact study. As shown in Table 7, three intersections have an acceptable LOS and two intersections are failing.

Table 7: Future 2027 Background Level of Service

Intersection	Future 2027 Background
Del Monte Road and SR-164 Arrowhead Trail Road	C
Calpac Avenue and SR-164 Arrowhead Trail Road	B
Woodland Hills Drive and SR-198	F
South Mill Road and Arrowhead Trail Road	F
SR-164 Arrowhead and Main street	B

E. Mitigation Measures

No mitigation measures are recommended for the intersections that are LOS C and higher. Mitigation measure recommendations for the two failing intersections are found in part II. Existing (2018) Conditions, section E: Mitigation Measures.

VII. FUTURE (2027) PLUS PROJECT CONDITIONS

A. Purpose

The purpose of the future 2027 plus project conditions is to examine the traffic impacts of the proposed project at each of the intersections during future 2027 conditions. The trips generated by the project development were combined with the future 2027 background traffic volumes to create the future plus project condition. The plus project conditions detail the important potential impacts of the proposed project on future background traffic conditions.

B. Traffic Volumes

Trips were assigned to the project location intersections based on the trip distribution percentages and permitted intersection turning movements. Base volumes were taken from the Future 2027 Background Conditions

C. LOS Analysis

The peak hour LOS for each intersection was found using Synchro Software. LOS reports from Synchro are contained in Appendix B of this traffic impact study. The results for the project conditions 2027 model serve as the condition for the impact analysis of the Arrowhead Center after the development has been existing for several years. As seen in Table 8, the same two intersections are failing and three intersections have an acceptable LOS C or higher. The two new intersections along SR-198 are already failing once constructed.

Table 8: Future 2027 Plus Project Level of Service

Intersection	Future 2027 Plus Project
Del Monte Road and SR-164 Arrowhead Trail Road	C
Calpac Avenue and SR-164 Arrowhead Trail Road	B
Woodland Hills Drive and SR-198	F
South Mill Road and Arrowhead Trail Road	F
SR-164 Arrowhead and Main street	B
New 3-Way Intersection with SR-198	F
New 4-Way Intersection with SR-198	F

D. Mitigation Measures

No mitigation measures are recommended for the intersections that are LOS C and higher. Mitigation measure recommendations for the existing failing intersections are found in part II. Existing (2018) Conditions, section E: Mitigation Measures. Recommendations for the two new intersections along SR-198 can be found in part V. Future (2022) Plus Project Conditions, section D: Mitigation Measures. A summary of the LOS after mitigation measures are implemented is found in Table 9.
